## MAIL ORDER LIBRARIES

The history of libraries is a story of the gradual evolution of private collections into public institutions. Just as in the home, the library is the room where one goes to read and study; so in the outside world, the institutional library is the place where one goes to consult the literature. This character of libraries as centers where useful information is sought, is brought into sharp relief by the perfection of service which specialized training enables librarians to render. It is only since the advent of microfilm that the impression is gradually gaining ground, that in addition to being centers where the literature can be consulted, libraries are also store houses from which this literature can be sent out to those living at a distance. This manner of extending the service which a library can render to the advancement of learning is slowly becoming more generally known.

The system of microfilm copying of periodical literature in libraries, until recently, has been handicapped by the necessity of conducting it as a subsidiary library function on a self-supporting basis. As such, it is a business enterprise in conflict with the long-established principles of free library service. Consequently, it has not received as cordial a reception as was expected.

The experiment conducted since January 1, 1943 in the Army Medical Library has demonstrated conclusively that when microfilm copying is conducted as an extension of library service, it is accepted with alacrity and permits a library to fulfill more completely and widely than ever before its purpose of aiding those who are engaged in the advancement of learning.

The Photoduplication Service has already become one of the principal activities of the Army Medical Library. It has increased nearly three times the statistical use made of its collections. Microfilm orders received by mail now account for about twice as many items as the total number called for by readers and sent out on loan.

(Continued on inside back cover)

**CURRENT LIST OF MEDICAL LITERATURE** is published weekly and lists of **RECENT BOOK ACQUISITIONS** are issued several times per year as supplements. The subscription price for both is \$5.00 per year in the United States and \$5.50 per year in other countries. The Recent Book Acquisitions may be obtained separately at \$1.00 per year. MIGRELL, R. F., & GORDON, M. A melanotic tumor in the silverside, Menidia beryllina peninsulae (Good and Bean). 45-6.

These microfilm orders are received from all the medical units of our own and allied forces, as well as from individuals, research institutions, and universities located throughout this country and elsewhere. Mail orders for more than 4,500 microfilms were filled during the month of April. This required nearly 200 bound and unbound periodicals to be taken from and returned to the shelves each day. The systematic organization of this work necessitates careful attention. An order from one source usually consists of a large number of items which either must be assembled before the microfilm copying is begun or if not, the separate microfilms require assembly when they are completed. Experience has not yet shown which plan is the better.

In spite of the fact that use of the library by readers and borrowers is comparatively small, the proportion of items ordered by microfilm which are not immediately available, due to being at the bindery or on loan, presents a considerable problem in completing each microfilm mail order. An attempt is made to keep track of the items which cannot be filmed immediately and to send them later, but this becomes an ever-increasing problem as the facilities of the service are already taxed to the utmost.

The Photoduplication Service is in fact a beehive of activity, which, since its installation, has committed the Army Medical Library to a role resembling that of a mail order library. In time there will be others which will do likewise, to the advancement of learning and to ever-increasing progress.

A. S.
